# Supplier Resilience Assessment

Complex PDF input with banner image, tables, multi-page narrative and figure caption

This PDF is deliberately rich in structure so it can serve as a realistic source file for Docling. It includes a cover section, a narrative summary, a formatted table, a second-page illustration and several callout blocks designed to test Markdown heading retention and reading order.

## 1. Assessment summary

The review focused on supplier concentration, route complexity, packaging dependency and incident recovery speed. Across the top twelve spend categories, single-source exposure remains material in specialized packaging, while transport resilience improved following the introduction of regional contingency lanes.

> *"Resilience does not come from more reporting alone; it comes from consistent evidence, clear thresholds and fast escalation when assumptions break."*

## 2. Heatmap table

| Category | Exposure | Lead time | Recovery readiness | Commentary |
|---|---|---|---|---|
| Packaging | High | 24 days | Medium | Dual-source contracting still in negotiation. |
| Electronics | Medium | 18 days | High | Component alternates qualified in two regions. |
| Logistics | Medium | 11 days | Medium | Seasonal capacity remains sensitive to weather. |
| Labeling | Low | 7 days | High | High standardization enables quick rerouting. |

### Priority actions

- Approve packaging second-source business case.
- Add documentary proof to all remediation closures.
- Convert appendix source files into Markdown and version them centrally.

## 3. Network view and reading-order stress test

Figure 1. Network-style logistics illustration included to test image references in extracted Markdown.

On the second page, the content intentionally alternates between image, caption, heading and dense narrative text. This helps evaluate whether a downstream converter preserves logical order rather than flattening the page into a visually convenient but semantically wrong sequence.

A robust converter should recognize headings, paragraph groups, bullet-like statements and captions. For born-digital PDFs, OCR should generally remain off so the system can rely on the native text layer, fonts and layout coordinates instead of re-reading the page as an image.

> *Closing note: this document is intended purely as a complex test asset and does not contain real operational data.*
